## Instructions

There are 14 questions on this examination paper. Answer all questions.
Questions do not necessarily carry equal marks. To help you manage your time during this examination, a maximum time for each question is suggested. If you remain within these times you should have about 10 minutes left to review your work.

Write your answers in the spaces provided in this booklet. You may lose marks if you do not do so. You may ask the superintendent for more paper. Label any extra work clearly with the question number and part.

The superintendent will give you a copy of the Formulae and Tables booklet. You must return it at the end of the examination. You are not allowed to bring your own copy into the examination.

You will lose marks if you do not show all necessary work.
You may lose marks if you do not include the appropriate units of measurement, where relevant.
You may lose marks if you do not give your answers in simplest form, where relevant.

Write the make and model of your calculator(s) here: $\square$

## Question 1

(a) A bus company increases the price of all of its tickets by $6 \%$.

Before the increase, the price of a ticket from Cork to Dublin was $€ 17 \cdot 00$.
(i) Find the price of this ticket after the increase.

Six months later, the company reduces the price of this ticket back to $€ 17 \cdot 00$.
(ii) Find the percentage decrease in the price of this ticket.

Give your answer correct to one decimal place.

The function $h(x)$ below gives the approximate height of the water at Howth Harbour on a particular day, from 12 noon to 5 p.m.

$$
h(x)=10 x^{2}-50 x+130
$$

where $h(x)$ is the height of the water in centimetres, and $x$ is the time in hours after 12 noon.
(a) Draw the graph of the function
(Suggested maximum time: 20 minutes)

Source: www.theirishlandscape.com. Altered.
$h(x)=10 x^{2}-50 x+130$
on the axes below, for $0 \leq x \leq 5, x \in \mathbb{R}$.

(b) Use your graph in part (a) to answer the following questions.
(i) Find the height of the water at 12 noon.

(ii) Estimate the height of the water at its lowest point.

(iii) After 12 noon, how long did it take before the water was at its lowest point?

The graph on the right shows the approximate height of the water in centimetres at Crookhaven on a different day, from 12 noon to 6 p.m. The graph is symmetrical.

On this day, the height of the water at 12 noon was 180 cm , and the height of the water at the lowest point on the graph was 0 cm .
(c) Taking $x$ as the time in hours after 12 noon, this graph is given by the function

$$
g(x)=a x^{2}+b x+c,
$$

where $a, b, c \in \mathbb{Z}$, and $x \in \mathbb{R}$.

Time
(hours after 12 noon)
(i) Find the value of $c$.

(ii) Hence, or otherwise, find the value of $a$ and the value of $b$.
